Pre- or co-requisite: Physics I (151 or 160) Lecture

Course Purpose & Description: Physics I Lab consists primarily of hands-on experiments designed to give the student a more intuitive grasp of topics discussed in lecture. The lab also gives the students the opportunity to test physics principles for themselves by measurement (or in some cases, by direct observation or experience), the ability to correctly use measuring instruments, and skill at propagating measured values with units through mathematical calculations.

At the instructor's discretion, lab time may occasionally be used to answer questions from lecture, for recitation (practice problems), and/or as "overtime" for tests from physics lecture.

Course learning objectives: By semester's end, the student with a B or higher grade should be able to demonstrate she/he can perform at least 12 of the following activities, including the bold-numbered items:

- 1) read analog instruments, including the meter stick, vernier caliper, and mass scale, to the correct precision.
- 2) correctly propagate measurements through calculations .
- 3) test, by experiment, formulas describing velocity and acceleration, and experience these phenomena directly,
- 4) use appropriate formulae and equipment to measure the acceleration of gravity (free-fall).
- 5) design and conduct an experiment to test the theory of ideal two-dimensional projectile motion.
- 6) test the 2nd law of motion by applying it to physical situations involving net force and acceleration.
- 7) calculate gravitational potential energy, power, and work from measurements taken of an actual physical process.
- 8) test the principle of conservation of mechanical energy in a low-friction environment.
- 9) find the coefficient of friction between two materials multiple ways, and in doing so confirm some of the analytical techniques which can be used for this purpose.
- 10) determine by experiment whether momentum and energy are conserved through elastic and inelastic collisions, respectively.
- 11) directly produce a centripetal force, and calculate centripetal force and acceleration.
- 12) directly experience effects of the law of conservation of angular momentum, and explain the behavior of selected rotating objects—including themselves--using that principle.
- 13) observe by measurement thermal energy transfer between material, and test the veracity of formulas describing that transfer.
- 14) predict the period and frequency of a spring-mass oscillator and of a pendulum
- 15) determine the acceleration of gravity using a simple pendulum and its theory, and in so doing confirm the veracity of the pendulum formula.

The instructor reserves the right to create new laboratory exercises, based upon inspiration and/or equipment availability, which may not be mentioned above, and which may supplant non-boldface items in that list. Any such new labs will either parallel or complement topics studied in lecture.

Academic dishonesty, including copying another student's lab, will be cause for a lowered grade or being dropped from the course.

Disruptive or unruly behavior such as ridiculing another student or the instructor, or intentional rough handling of/damage to lab equipment, will result in being expelled from the class.

Electronic Communication Devices (incl cellphones, laptops) OFF in the classroom; No phone activity of any kind; NO text messaging in the labroom during lab.

Disability: If you have a documented disability, please provide a letter from Equal Access Services as soon as possible, to ensure that appropriate accommodations are made in a timely manner.

There will be **no makeup labs**; if a lab is missed, the score for that lab is zero and the student cannot receive an A+. However, the lowest score will be dropped at semester's end, so if circumstances force you to miss one lab, that zero will count as the one (and only) score dropped, and you can still receive as high as an "A". Additional missed labs will average into the final lab grade with value Zero.

Lab Reports: A lab report will occasionally be required, on labs specified by the instructor. So, hold on to your lab worksheets after they are returned to you.

Grading: Each lab will be accompanied by a worksheet, which will outline theory and procedures, and which will contain space for showing measurements, reasoning, calculations, and answering questions. The worksheet will be turned in at the end of the lab for grading.

Individual labs, lab reports, and the overall course grade will be determined according to the following scheme:

$97.5 \leq x \leq 100\%$	A+	(unless a lab is missed.)
$92.5 \leq x < 97.5$	A	
$90 \leq x < 92.5$	A-	
$87.5 \leq x < 90$	B+	
$82.5 \leq x < 87.5$	B	
$80 \leq x < 82.5$	B-	
$77.5 \leq x < 80$	C+	
$72.5 \leq x < 77.5$	C	
$70 \leq x < 72.5$	C-	
$60 \leq x < 70$	D	
Below 60%	F
